Follow-up: ATM failure is becoming branch workload

Hi,

This came up in a working session and nobody had the same definition.

ATM failures and blocked-card issues can shift customers toward branches, especially during infrastructure disruption.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: specific provinces show repeat access failure; cash-bin or host issues dominate; or customers switch to smaller withdrawals or branch contact.

The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2023 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is where contingency communication and ATM support should be prioritised. Please bring a Power BI page with drill-through to a reproducible case list, including a few cases we can trace from source to conclusion.

The available evidence is ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; monthly customer and KYC snapshots. The data does not contain branch cash holdings or queue time.

Thank you
