Follow-up: the oldest issue may not be the largest one

Team,

Before this becomes another standing report, can we answer the real question?

Operations needs an ageing view that prioritises unresolved customer impact rather than raw exception count. The possible stories are that status updates close records without resolving the transaction, that older cases cluster in one process, or that small-value cases remain open because ownership is unclear.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2023 as the new evidence point rather than recycling the earlier conclusion. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Please prepare a Power BI page with drill-through to a reproducible case list. The output must help us decide the exception priority rule and escalation threshold.

Data available: transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; collections cases, promises to pay and recovery payments; monthly account snapshots, status events, limits, product enrolments and signatories.

Please state the limitation plainly: Use observable dates and outcomes; do not infer internal queue age where no queue record exists.

Thanks
