Which customer journeys depend on the same external party?

Hi,

This came up in a working session and nobody had the same definition.

Vendor Risk needs a first-pass dependency map showing where the same external context appears across multiple customer journeys.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: one provider sits behind several channels; apparent concentration is a source-label problem; or the most frequent provider is not the most harmful.

The timing also overlaps with Prolonged Stage 6 load shedding returns. Treat that as context to test, not an answer.

What we need to decide is which dependencies need proper inventory, resilience testing or exit planning. Please bring a short decision pack with no more than five slides and an attached evidence table, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; SWIFT messages, correspondent alerts and nostro breaks. This is a behavioural dependency proxy, not a complete outsourcing register.

Thank you
