Do the beneficiary changes form a correspondent-banking pattern?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

External alerts identify repeated beneficiary and intermediary-bank patterns that need to be tested against the underlying customers and payment chronology. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Could the answer be that legitimate trade activity explains common beneficiaries? Or are we actually seeing that settlement delay and suspicious routing are separate issues? I also do not want us to miss the possibility that split transfers avoid normal review.

The practical decision is which payments require enhanced review, reporting consideration or closure as explained activity. Please send a short decision pack with no more than five slides and an attached evidence table; I need the exceptions and counter-examples, not only an average.

Work from SWIFT messages, correspondent alerts and nostro breaks; monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context. Use named customers only inside the restricted working paper; the analytical output must remain an allegation-free triage view.

Regards
