Follow-up: A resilience rehearsal using real customer journeys

Hi,

This came up in a working session and nobody had the same definition.

The resilience plan lists systems, but customers experience end-to-end services that cross ATM, card, transaction and communication processes.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: manual workarounds create later reconciliation breaks; cash access degrades before account servicing; or recovery restores authorisation before posting catches up.

The timing also overlaps with Prolonged Stage 6 load shedding returns. Treat that as context to test, not an answer. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2023 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is the order in which critical services should be recovered and tested. Please bring a working Excel file with the exception population and clear columns, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions; debit-order mandates, collection dates, suspensions and cancellations. Treat this as a historical service-impact rehearsal, not proof of infrastructure capacity.

Thank you
