Follow-up: the currency exposure needs a customer-behaviour view

Morning,

I need help with something that sounds simple but probably is not.

Treasury sees non-rand activity but needs to separate stable customer behaviour from isolated transactions and data artefacts. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. Different teams have produced different answers from the same period, so population and timing rules need to be visible.

The questions I would ask in the room are:

1. What would we expect to see if cross-border-enabled accounts are not the same as active cross-border users?
2. What evidence would instead support that a small group of customers drives most foreign-currency activity?
3. How do we rule out that loan participations explain part of the flow?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use October 2023 as the new evidence point rather than recycling the earlier conclusion. Please work towards whether to improve forecasting assumptions or investigate specific flow concentrations. A useful output would be a control view with the exceptions, owner and reason each item was included.

Use monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; loan participation and servicing records available by the request date. One caution: This data does not contain market positions, hedges or intraday liquidity; report customer-flow concentration only.

Regards
