Follow-up: payment retries need an outcome-level control

Hi team,

Payment attempts, reversals and late postings can create apparent duplicates or genuine duplicate customer impact.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2023 as the new evidence point rather than recycling the earlier conclusion. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Can you test these explanations rather than choosing one at the start?

- late settlement creates false duplicates
- retries are correctly linked
- some customers were debited more than once before reversal

The decision is the matching rule, customer-impact list and preventive control. Please give us a model-ready table, data dictionary and an honest baseline.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; customer contacts, complaints and suggestions. Statement evidence is available only for selected accounts; use transaction identifiers and timing for the full population.

Thanks
