Follow-up: card replacement may be solving one problem and creating another

Morning,

I need help with something that sounds simple but probably is not.

Card Operations needs to know whether replacement cards become usable quickly and whether old-card attempts continue after reissue. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

The questions I would ask in the room are:

1. What would we expect to see if old credentials continue to generate declines?
2. What evidence would instead support that ATM and transaction channels reflect card history differently?
3. How do we rule out that customers resume normal use quickly?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2023 as the new evidence point rather than recycling the earlier conclusion. Please work towards which reissue controls or customer messages need improvement. A useful output would be a control view with the exceptions, owner and reason each item was included.

Use monthly account snapshots, status events, limits, product enrolments and signatories; ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions. One caution: Card numbers are historical lists in the account snapshot; use issue and expiry dates to determine the active card.

Regards
