Follow-up: does the model treat data quality as customer risk?

Team,

Before this becomes another standing report, can we answer the real question?

Model Risk is concerned that channel, document availability and data completeness may become proxies for customer groups rather than genuine risk. The possible stories are that branch and digital populations differ before modelling, that missing documents drive predictions, or that performance gaps disappear after controlling for product and income.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use January 2024 as the new evidence point rather than recycling the earlier conclusion. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

Please prepare a Power BI page with drill-through to a reproducible case list. The output must help us decide which features need restriction, monitoring or clearer business justification.

Data available: monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments.

Please state the limitation plainly: Protected-attribute analysis must be governed and access-controlled; do not use ethnicity or gender for targeting or adverse treatment.

Thanks
