Can we identify the deposit population before the formal return build?

Morning,

I need help with something that sounds simple but probably is not.

Reporting wants to test whether customer type, account type, currency, status and ownership fields can support a future deposit population. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

The questions I would ask in the room are:

1. What would we expect to see if joint and company accounts need separate treatment?
2. What evidence would instead support that missing ownership or currency fields create the main exceptions?
3. How do we rule out that product classifications are consistent?

Please work towards the data remediation backlog before formal regulatory logic is implemented. A useful output would be a model-ready table, data dictionary and an honest baseline.

Use monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; account signatory and ownership-role records. One caution: No daily balances or official deposit-insurance rules are encoded here; assess data readiness only.

Regards
