Where does self-service hand the customer a new problem?

Hi,

This came up in a working session and nobody had the same definition.

Digital containment is being reported as success even when customers later call, visit a branch or complain.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: certain intents should begin with an agent; contained contacts resolve the need; or handover occurs too late.

Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

What we need to decide is which intents belong in self-service and how success should be measured. Please bring a short decision pack with no more than five slides and an attached evidence table, including a few cases we can trace from source to conclusion.

The available evidence is customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories. Containment is a proxy; use repeat contact and observable outcomes rather than claiming customer satisfaction.

Thank you
