Follow-up: promise-to-pay quality, not collector volume

Hi team,

Collectors record promises with different amounts and dates, and management needs a fair measure of promise quality.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use February 2024 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Can you test these explanations rather than choosing one at the start?

- channel and timing affect outcomes
- affordable promises are kept more often
- partial payments are being treated inconsistently

The decision is the promise definition, coaching view and model target. Please give us a Power BI page with drill-through to a reproducible case list.

You should be able to build the evidence from collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; customer contacts, complaints and suggestions. Do not rank individual collectors without workload, assignment and contact-attempt history.

Thanks
