Follow-up: the participation file needs an operational responsibility map

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

A loan participation question has exposed confusion about which bank originated, serviced and carried each risk share. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. Different teams have produced different answers from the same period, so population and timing rules need to be visible.

Could the answer be that customer-facing activity is being attributed to the wrong institution? Or are we actually seeing that the records clearly support the operating model? I also do not want us to miss the possibility that servicing actions do not align with the stated role.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use March 2024 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which cases require document review and which are data-quality corrections. Please send a control view with the exceptions, owner and reason each item was included; I need the exceptions and counter-examples, not only an average.

Work from loan participation and servicing records available by the request date; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; debit-order mandates, collection dates, suspensions and cancellations; collections cases, promises to pay and recovery payments. The dataset records roles and activity but is not the signed legal agreement.

Regards
