Follow-up: card blocks need a customer-harm view

Hi team,

Card blocking protects customers, but repeated legitimate attempts and later complaints may reveal controls that are too blunt.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use April 2024 as the new evidence point rather than recycling the earlier conclusion. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

Can you test these explanations rather than choosing one at the start?

- customers receive inconsistent recovery paths
- blocked cards follow genuinely unusual sequences
- ordinary PIN errors create avoidable blocks

The decision is where thresholds, escalation or customer communication should change. Please give us a one-page finding note plus the underlying CSV for our own review.

You should be able to build the evidence from ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. Do not label a block as incorrect without the rule decision and investigation outcome.

Thanks
