Follow-up: debit day, salary timing and avoidable failure

Morning,

I need help with something that sounds simple but probably is not.

Payments wants to test whether collection timing, rather than inability to pay, explains repeat debit-order failure. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

The questions I would ask in the room are:

1. What would we expect to see if fixed collection rules work differently across customer groups?
2. What evidence would instead support that collection before regular inflow drives failure?
3. How do we rule out that retry timing improves success?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use April 2024 as the new evidence point rather than recycling the earlier conclusion. Please work towards whether to test alternative debit dates or change retry logic. A useful output would be a model-ready table, data dictionary and an honest baseline.

Use debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments. One caution: Regular inflows are inferred from transaction patterns; no verified payroll calendar is available.

Regards
