Follow-up: does closure propagate to every downstream process?

Morning,

I need help with something that sounds simple but probably is not.

Internal Audit wants to test whether an account status change consistently stops transactions, ATM access, debit orders, collections and campaigns. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

The questions I would ask in the room are:

1. What would we expect to see if some downstream systems lag?
2. What evidence would instead support that manual exceptions are not documented consistently?
3. How do we rule out that controls propagate on the same day?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2024 as the new evidence point rather than recycling the earlier conclusion. Please work towards whether this is an isolated exception, a design weakness or a control operating failure. A useful output would be a short decision pack with no more than five slides and an attached evidence table.

Use monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; debit-order mandates, collection dates, suspensions and cancellations; collections cases, promises to pay and recovery payments; campaign design and customer responses. One caution: The result is a data-based control test and still requires process-owner evidence.

Regards
