Follow-up: late posting, retries and unusual behaviour are being mixed

Hi team,

Investigators report that some suspicious patterns disappear once transaction timing, retries and customer contacts are reconstructed.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use June 2024 as the new evidence point rather than recycling the earlier conclusion. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Can you test these explanations rather than choosing one at the start?

- a known service interaction explains the change
- bank-side delay creates impossible sequences
- repeated attempts inflate velocity

The decision is which alert features should be corrected, retained or routed elsewhere. Please give us a control view with the exceptions, owner and reason each item was included.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions; monthly account snapshots, status events, limits, product enrolments and signatories. A plausible explanation is not automatic clearance; investigators still own the decision.

Thanks
