Follow-up: promise-to-pay cash is not matching cleanly

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Collections and Finance are using different notions of a successful recovery, especially when payments arrive after the promised date or through another channel. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Could the answer be that late payments are being treated as broken promises? Or are we actually seeing that a payment reaches the account but not the collections case? I also do not want us to miss the possibility that partial cures are being reported as full cures.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use June 2024 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the definition of cure and the exception queue that Finance and Collections will both use. Please send a working Excel file with the exception population and clear columns; I need the exceptions and counter-examples, not only an average.

Work from collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields. The data can reconcile customer and case activity, but not the accounting ledger entry.

Regards
