Follow-up: the avoidable-work question for EXCO

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Digital use is rising, but repeat calls, branch visits and failed journeys may mean the bank is serving the same need more than once. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Could the answer be that a small set of broken journeys creates most repeat contact? Or are we actually seeing that customers begin digitally and finish through an assisted channel? I also do not want us to miss the possibility that digital journeys are resolving customer needs.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use June 2024 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which journeys should be fixed before another channel-adoption campaign is funded. Please send a one-page finding note plus the underlying CSV for our own review; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories. The dataset can measure repeat contacts and channel sequences, not fully allocated service cost.

Regards
