Follow-up: the metric is stable only because the definition keeps moving

Hi team,

Analytics is receiving requests that use the same business term for different populations, dates and customer relationships.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2024 as the new evidence point rather than recycling the earlier conclusion. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

Can you test these explanations rather than choosing one at the start?

- an undocumented exclusion is changing the denominator
- the teams need different metrics
- snapshot timing creates the difference

The decision is the governed definition, owner, exclusions and reconciliation bridge. Please give us a one-page finding note plus the underlying CSV for our own review.

You should be able to build the evidence from monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context. A technically consistent definition still needs business ownership and approval.

Thanks
