Follow-up: ageing operational exceptions by customer harm

Morning,

I need help with something that sounds simple but probably is not.

Operations needs an ageing view that prioritises unresolved customer impact rather than raw exception count. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

The questions I would ask in the room are:

1. What would we expect to see if small-value cases remain open because ownership is unclear?
2. What evidence would instead support that status updates close records without resolving the transaction?
3. How do we rule out that older cases cluster in one process?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2024 as the new evidence point rather than recycling the earlier conclusion. Please work towards the exception priority rule and escalation threshold. A useful output would be a control view with the exceptions, owner and reason each item was included.

Use transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; collections cases, promises to pay and recovery payments; monthly account snapshots, status events, limits, product enrolments and signatories. One caution: Use observable dates and outcomes; do not infer internal queue age where no queue record exists.

Regards
