Follow-up: the same symptom can belong to Cyber or Operations

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Timeouts, host-response failures and repeated attempts can resemble malicious activity or ordinary service degradation. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Could the answer be that operational retries are obscuring the original event? Or are we actually seeing that technical failure explains the cluster? I also do not want us to miss the possibility that a concentrated account or terminal pattern suggests abuse.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2024 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the minimum evidence needed to route an alert to Cyber, Fraud, Payments or Infrastructure. Please send a working Excel file with the exception population and clear columns; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency. This is triage design from available telemetry, not a substitute for SOC, firewall or application logs.

Regards
