Deposit reporting readiness from the account data

Morning,

I need help with something that sounds simple but probably is not.

Reporting wants to test whether customer type, account type, currency, status and ownership fields can support a future deposit population. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

The questions I would ask in the room are:

1. What would we expect to see if joint and company accounts need separate treatment?
2. What evidence would instead support that product classifications are consistent?
3. How do we rule out that missing ownership or currency fields create the main exceptions?

We looked at a version of this before. For the September 2024 review, please show what changed and whether the earlier conclusion still holds. Please work towards the data remediation backlog before formal regulatory logic is implemented. A useful output would be a short decision pack with no more than five slides and an attached evidence table.

Use monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; account signatory and ownership-role records. One caution: No daily balances or official deposit-insurance rules are encoded here; assess data readiness only.

Regards
