Follow-up: the loan return needs a population bridge

Morning,

I need help with something that sounds simple but probably is not.

Risk, Lending and Reporting are counting applications, approvals, booked loans and distressed accounts from different starting populations. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

The questions I would ask in the room are:

1. What would we expect to see if workflow timing explains most differences?
2. What evidence would instead support that declined and withdrawn cases are mixed?
3. How do we rule out that booked loans are missing from downstream repayment views?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use October 2024 as the new evidence point rather than recycling the earlier conclusion. Please work towards the canonical population and exception rules for the next return. A useful output would be a Power BI page with drill-through to a reproducible case list.

Use the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context. One caution: Do not present this as an official regulatory return without the required regulatory taxonomy and sign-off.

Regards
