Follow-up: repeat contact is exposing broken ownership

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Customer Experience wants to understand which issues return within days and whether the customer changes channel to get an answer. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Could the answer be that transaction posting changed after the first answer? Or are we actually seeing that channel handover loses context? I also do not want us to miss the possibility that the first contact did not resolve the issue.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use October 2024 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which journeys need process redesign, clearer wording or ownership. Please send a one-page finding note plus the underlying CSV for our own review; I need the exceptions and counter-examples, not only an average.

Work from customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; debit-order mandates, collection dates, suspensions and cancellations. Communication records do not contain every call recording or agent action, so measure observable repeat contact.

Regards
