Follow-up: are cross-border flows recurring or episodic?

Hi team,

Treasury sees non-rand activity but needs to separate stable customer behaviour from isolated transactions and data artefacts.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use October 2024 as the new evidence point rather than recycling the earlier conclusion. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Can you test these explanations rather than choosing one at the start?

- cross-border-enabled accounts are not the same as active cross-border users
- loan participations explain part of the flow
- a small group of customers drives most foreign-currency activity

The decision is whether to improve forecasting assumptions or investigate specific flow concentrations. Please give us a working Excel file with the exception population and clear columns.

You should be able to build the evidence from monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; loan participation and servicing records available by the request date. This data does not contain market positions, hedges or intraday liquidity; report customer-flow concentration only.

Thanks
