Quick question: is the correspondent relationship creating repeated operational risk?

Hi team,

A small set of intermediary banks appears in settlement delays and routing alerts, raising both service and risk questions.

Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

Can you test these explanations rather than choosing one at the start?

- the operational and financial-crime populations overlap only partly
- one intermediary drives most delay
- beneficiary patterns explain the alerts

The decision is whether to escalate the correspondent, change monitoring or gather contractual evidence. Please give us a Power BI page with drill-through to a reproducible case list.

You should be able to build the evidence from SWIFT messages, correspondent alerts and nostro breaks; transaction-level timestamps, channels, amounts, statuses and error context. Exception files do not contain the full correspondent contract or all successful traffic.

Thanks
