Correspondent delays are becoming a Treasury question

Team,

Before this becomes another standing report, can we answer the real question?

Correspondent payment delays and beneficiary-routing alerts may be creating both liquidity noise and financial-crime exposure. The possible stories are that specific intermediaries create repeated settlement delay, that split payments are concentrating on common beneficiaries, or that late confirmations explain most breaks.

We looked at a version of this before. For the November 2024 review, please show what changed and whether the earlier conclusion still holds. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

Please prepare a Power BI page with drill-through to a reproducible case list. The output must help us decide whether to change correspondent limits, escalate a bank relationship or tighten pre-payment review.

Data available: SWIFT messages, correspondent alerts and nostro breaks; transaction-level timestamps, channels, amounts, statuses and error context; monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories.

Please state the limitation plainly: Do not infer the bank's full nostro position from exception records.

Thanks
