Split payments, common beneficiaries and intermediary routing

Team,

Before this becomes another standing report, can we answer the real question?

External alerts identify repeated beneficiary and intermediary-bank patterns that need to be tested against the underlying customers and payment chronology. The possible stories are that split transfers avoid normal review, that legitimate trade activity explains common beneficiaries, or that settlement delay and suspicious routing are separate issues.

We looked at a version of this before. For the November 2024 review, please show what changed and whether the earlier conclusion still holds. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Please prepare a one-page finding note plus the underlying CSV for our own review. The output must help us decide which payments require enhanced review, reporting consideration or closure as explained activity.

Data available: SWIFT messages, correspondent alerts and nostro breaks; monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context.

Please state the limitation plainly: Use named customers only inside the restricted working paper; the analytical output must remain an allegation-free triage view.

Thanks
