Follow-up: decline reason versus customer outcome

Hi,

This came up in a working session and nobody had the same definition.

The same decline code can lead to a successful retry, an ATM attempt, a phone call or lost activity.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: repeat declines cluster by card state or channel; most declines recover immediately; or poor explanations drive complaints more than the decline itself.

Please start with the decision we need to make, then show whether the available evidence is strong enough to support it. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use November 2024 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is which decline reasons need rule, message or service changes. Please bring a short decision pack with no more than five slides and an attached evidence table, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. The data does not contain merchant terminal logs or card-scheme dispute outcomes.

Thank you
