Follow-up: historical file does not always mean historical truth

Morning,

I need help with something that sounds simple but probably is not.

Repeated monthly parquet snapshots contain fields that may be updated retrospectively, creating risk for trend analysis and models. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

The questions I would ask in the room are:

1. What would we expect to see if records preserve true as-at state?
2. What evidence would instead support that closure or status fields are backfilled?
3. How do we rule out that CDC fragments and snapshots are being combined incorrectly?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use January 2025 as the new evidence point rather than recycling the earlier conclusion. Please work towards which fields need event tables, effective dating or restricted use. A useful output would be a working Excel file with the exception population and clear columns.

Use monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields. One caution: Do not assume a file path date is the effective date of every field.

Regards
