How stable are our retail inflows? - 2025 control review

Hi team,

ALM wants a directional view of retail funding stability based on transaction behaviour and account persistence.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use June 2025 as the new evidence point rather than recycling the earlier conclusion. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Can you test these explanations rather than choosing one at the start?

- customers with service problems move money out faster
- large opening deposits overstate durable funding
- salary-like and recurring inflows are more stable

The decision is which behavioural assumptions deserve formal modelling when balance and regulatory data become available. Please give us a Power BI page with drill-through to a reproducible case list.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; available initial-deposit records up to the request date; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. There are no daily account balances, wholesale funding positions or regulatory cash-flow buckets, so do not calculate LCR or NSFR.

Thanks
