Which exceptions create the most manual work? - 2025 control review

Morning,

I need help with something that sounds simple but probably is not.

Operations wants a proxy for cases repeatedly touched across Payments, Collections, Customer Experience and Finance. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

The questions I would ask in the room are:

1. What would we expect to see if unclear ownership keeps cases open?
2. What evidence would instead support that a small set of exception types creates most hand-offs?
3. How do we rule out that late posting generates downstream work?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2025 as the new evidence point rather than recycling the earlier conclusion. Please work towards which process should be redesigned and where ownership should sit. A useful output would be a Power BI page with drill-through to a reproducible case list.

Use transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; collections cases, promises to pay and recovery payments; debit-order mandates, collection dates, suspensions and cancellations. One caution: There is no work-queue or staff-time table, so report observable hand-offs and repeat events rather than labour hours.

Regards
