Follow-up: the account closes once; the bank may need to close it five times

Hi,

This came up in a working session and nobody had the same definition.

Internal Audit wants to test whether an account status change consistently stops transactions, ATM access, debit orders, collections and campaigns.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: manual exceptions are not documented consistently; some downstream systems lag; or controls propagate on the same day.

Please start with the decision we need to make, then show whether the available evidence is strong enough to support it. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2025 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is whether this is an isolated exception, a design weakness or a control operating failure. Please bring a control view with the exceptions, owner and reason each item was included, including a few cases we can trace from source to conclusion.

The available evidence is monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; debit-order mandates, collection dates, suspensions and cancellations; collections cases, promises to pay and recovery payments; campaign design and customer responses. The result is a data-based control test and still requires process-owner evidence.

Thank you
