Follow-up: digital volume is not the same as lower cost

Team,

Before this becomes another standing report, can we answer the real question?

Digital use is rising, but repeat calls, branch visits and failed journeys may mean the bank is serving the same need more than once. The possible stories are that digital journeys are resolving customer needs, that customers begin digitally and finish through an assisted channel, or that a small set of broken journeys creates most repeat contact.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2025 as the new evidence point rather than recycling the earlier conclusion. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Please prepare a control view with the exceptions, owner and reason each item was included. The output must help us decide which journeys should be fixed before another channel-adoption campaign is funded.

Data available: transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories.

Please state the limitation plainly: The dataset can measure repeat contacts and channel sequences, not fully allocated service cost.

Thanks
