Vendor performance without a vendor master - 2025 control review

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Third-Party Risk wants to understand whether external dependencies are repeatedly associated with failed or delayed customer journeys. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Could the answer be that third-party timeouts cluster by channel? Or are we actually seeing that internal latency is being attributed externally? I also do not want us to miss the possibility that repeat incidents create disproportionate customer contact.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2025 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which supplier relationship requires evidence gathering or a formal service review. Please send a working Excel file with the exception population and clear columns; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. There is no vendor master, contract, SLA or invoice table. Treat external-context fields as indicators, not contractual proof.

Regards
