Did digital adoption remove friction or move it? - 2025 control review

Hi,

This came up in a working session and nobody had the same definition.

Product needs to define successful channel adoption as sustained useful activity rather than enrolment or one event.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: first successful use predicts continued use; adoption differs by product and customer need; or customers return to assisted channels after failure.

There is no confirmed problem yet; this is a request to test an assumption before it becomes policy. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use October 2025 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is which onboarding journey and success metric should change. Please bring a model-ready table, data dictionary and an honest baseline, including a few cases we can trace from source to conclusion.

The available evidence is monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; ATM attempts, host responses, PIN attempts, blocked-card state and latency. Available data supports channel behaviour but not every app screen, click or abandoned session.

Thank you
