What is driving the non-rand flow? - 2025 control review

Team,

Before this becomes another standing report, can we answer the real question?

Treasury sees non-rand activity but needs to separate stable customer behaviour from isolated transactions and data artefacts. The possible stories are that loan participations explain part of the flow, that cross-border-enabled accounts are not the same as active cross-border users, or that a small group of customers drives most foreign-currency activity.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use October 2025 as the new evidence point rather than recycling the earlier conclusion. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

Please prepare a one-page finding note plus the underlying CSV for our own review. The output must help us decide whether to improve forecasting assumptions or investigate specific flow concentrations.

Data available: monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; loan participation and servicing records available by the request date.

Please state the limitation plainly: This data does not contain market positions, hedges or intraday liquidity; report customer-flow concentration only.

Thanks
