Are we seeing pass-through accounts or ordinary cash-flow behaviour? - 2025 control review

Morning,

I need help with something that sounds simple but probably is not.

Financial Crime wants to test whether rapid receipt and onward movement forms a network pattern or reflects ordinary customer behaviour. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

The questions I would ask in the room are:

1. What would we expect to see if shared beneficiaries connect otherwise separate customers?
2. What evidence would instead support that salary, family support or business cash flow explains the pattern?
3. How do we rule out that new accounts act as pass-through accounts?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2025 as the new evidence point rather than recycling the earlier conclusion. Please work towards which cases deserve investigation and which monitoring rule needs a better peer group. A useful output would be a working Excel file with the exception population and clear columns.

Use transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; debit-order mandates, collection dates, suspensions and cancellations. One caution: The output is a triage hypothesis. Do not label a customer a mule without investigation and external evidence.

Regards
