Two source files tell different stories about the same event

Morning,

I need help with something that sounds simple but probably is not.

A requested analysis changes depending on whether the team starts from transaction, debit-order, account-status or customer-contact records. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

The questions I would ask in the room are:

1. What would we expect to see if one source is updated retrospectively?
2. What evidence would instead support that the sources record different stages of one event?
3. How do we rule out that matching logic is joining unrelated records?

Please work towards the source precedence rule and the cases that must remain explicitly unresolved. A useful output would be a model-ready table, data dictionary and an honest baseline.

Use transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. One caution: Do not force agreement by dropping exceptions; preserve contradictory evidence for owner review.

Regards
