Which exceptions quietly become old?

Morning,

I need help with something that sounds simple but probably is not.

Operations needs an ageing view that prioritises unresolved customer impact rather than raw exception count. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

The questions I would ask in the room are:

1. What would we expect to see if small-value cases remain open because ownership is unclear?
2. What evidence would instead support that older cases cluster in one process?
3. How do we rule out that status updates close records without resolving the transaction?

Please work towards the exception priority rule and escalation threshold. A useful output would be a model-ready table, data dictionary and an honest baseline.

Use transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; collections cases, promises to pay and recovery payments; monthly account snapshots, status events, limits, product enrolments and signatories. One caution: Use observable dates and outcomes; do not infer internal queue age where no queue record exists.

Regards
