Why did the payment fail, and who owns the fix?

Hi,

This came up in a working session and nobody had the same definition.

Operations is grouping all failed payments together even though the next action depends on the actual cause.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: mandate status or retry sequencing explains the event; insufficient funds explains the event; or third-party or bank timeout explains the event.

The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

What we need to decide is the operational owner, customer message and monitoring rule for each failure family. Please bring a short decision pack with no more than five slides and an attached evidence table, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. Do not infer a technical component failure beyond the error and timing fields available.

Thank you
