Quick question: did digital adoption remove friction or move it?

Hi team,

Product needs to define successful channel adoption as sustained useful activity rather than enrolment or one event.

The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Can you test these explanations rather than choosing one at the start?

- customers return to assisted channels after failure
- first successful use predicts continued use
- adoption differs by product and customer need

The decision is which onboarding journey and success metric should change. Please give us a one-page finding note plus the underlying CSV for our own review.

You should be able to build the evidence from monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; ATM attempts, host responses, PIN attempts, blocked-card state and latency. Available data supports channel behaviour but not every app screen, click or abandoned session.

Thanks
