Resolved in the system, but resolved for the customer?

Morning,

I need help with something that sounds simple but probably is not.

Complaint status alone may overstate resolution when the same customer returns, the transaction remains unresolved or the account closes. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

The questions I would ask in the room are:

1. What would we expect to see if resolution notes are generic?
2. What evidence would instead support that specific categories lead to repeat contact or attrition?
3. How do we rule out that resolved complaints do not recur?

Please work towards which complaint outcomes need quality review and which root causes need fixing. A useful output would be a Power BI page with drill-through to a reproducible case list.

Use customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories. One caution: The analysis can identify recurrence and later behaviour, not customer satisfaction that was never recorded.

Regards
