Which service fails first under operating stress?

Hi team,

The resilience plan lists systems, but customers experience end-to-end services that cross ATM, card, transaction and communication processes.

There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Can you test these explanations rather than choosing one at the start?

- cash access degrades before account servicing
- manual workarounds create later reconciliation breaks
- recovery restores authorisation before posting catches up

The decision is the order in which critical services should be recovered and tested. Please give us a model-ready table, data dictionary and an honest baseline.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions; debit-order mandates, collection dates, suspensions and cancellations. Treat this as a historical service-impact rehearsal, not proof of infrastructure capacity.

Thanks
