Which promises are realistic at the moment they are made?

Hi team,

Collectors record promises with different amounts and dates, and management needs a fair measure of promise quality.

There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Can you test these explanations rather than choosing one at the start?

- channel and timing affect outcomes
- affordable promises are kept more often
- partial payments are being treated inconsistently

The decision is the promise definition, coaching view and model target. Please give us a control view with the exceptions, owner and reason each item was included.

You should be able to build the evidence from collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; customer contacts, complaints and suggestions. Do not rank individual collectors without workload, assignment and contact-attempt history.

Thanks
