Why did the customer have to ask twice?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Customer Experience wants to understand which issues return within days and whether the customer changes channel to get an answer. There is no confirmed problem yet; this is a request to test an assumption before it becomes policy.

Could the answer be that the first contact did not resolve the issue? Or are we actually seeing that transaction posting changed after the first answer? I also do not want us to miss the possibility that channel handover loses context.

The practical decision is which journeys need process redesign, clearer wording or ownership. Please send a one-page finding note plus the underlying CSV for our own review; I need the exceptions and counter-examples, not only an average.

Work from customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; debit-order mandates, collection dates, suspensions and cancellations. Communication records do not contain every call recording or agent action, so measure observable repeat contact.

Regards
