Are we blocking the right cards for the right reasons?

Hi team,

Card blocking protects customers, but repeated legitimate attempts and later complaints may reveal controls that are too blunt.

Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

Can you test these explanations rather than choosing one at the start?

- ordinary PIN errors create avoidable blocks
- blocked cards follow genuinely unusual sequences
- customers receive inconsistent recovery paths

The decision is where thresholds, escalation or customer communication should change. Please give us a Power BI page with drill-through to a reproducible case list.

You should be able to build the evidence from ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. Do not label a block as incorrect without the rule decision and investigation outcome.

Thanks
