Which timestamp should the analysis trust?

Morning,

I need help with something that sounds simple but probably is not.

A requested analysis changes depending on whether the team starts from transaction, debit-order, account-status or customer-contact records. Please start with the decision we need to make, then show whether the available evidence is strong enough to support it.

The questions I would ask in the room are:

1. What would we expect to see if the sources record different stages of one event?
2. What evidence would instead support that one source is updated retrospectively?
3. How do we rule out that matching logic is joining unrelated records?

We looked at a version of this before. For the October 2019 review, please show what changed and whether the earlier conclusion still holds. Please work towards the source precedence rule and the cases that must remain explicitly unresolved. A useful output would be a model-ready table, data dictionary and an honest baseline.

Use transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. One caution: Do not force agreement by dropping exceptions; preserve contradictory evidence for owner review.

Regards
