Useful does not mean everyone should see it

Hi team,

Teams are asking for customer identity, risk, income and contact fields in broad analytical extracts.

We looked at a version of this before. For the October 2019 review, please show what changed and whether the earlier conclusion still holds. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Can you test these explanations rather than choosing one at the start?

- most use cases need derived or masked fields
- different projects require different retention and access
- restricted identifiers are being copied for convenience

The decision is the shared schema, restricted extension and audit trail. Please give us a one-page finding note plus the underlying CSV for our own review.

You should be able to build the evidence from monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. Minimise access to identity, contact, protected and investigation fields; usefulness alone is not a lawful purpose.

Thanks
